

WordPress + MySQL with Docker Compose (Step-by-Step Guide)

What You're Building

A complete WordPress setup using Docker Compose with:

- WordPress (PHP + Apache)
- MySQL database

Step 1: Install prerequisites

Check Docker:

```
docker --version
```

Check Docker Compose:

```
docker compose version
```

Step 2: Create project folder

```
mkdir wordpress-docker  
cd wordpress-docker
```

Step 3: Create docker-compose.yml

```
version: '3.9'  
  
services:  
  db:  
    image: mysql:8.0  
    container_name: wordpress_db  
    restart: always  
    environment:  
      MYSQL_ROOT_PASSWORD: rootpassword  
      MYSQL_DATABASE: wordpress  
      MYSQL_USER: wpuser  
      MYSQL_PASSWORD: wppassword  
    volumes:  
      - db_data:/var/lib/mysql  
  
  wordpress:  
    image: wordpress:latest  
    container_name: wordpress_app  
    depends_on:  
      - db  
    ports:  
      - "8080:80"  
    restart: always  
    environment:  
      WORDPRESS_DB_HOST: db:3306  
      WORDPRESS_DB_USER: wpuser  
      WORDPRESS_DB_PASSWORD: wppassword  
      WORDPRESS_DB_NAME: wordpress
```

```
volumes:
  - wp_data:/var/www/html

volumes:
  db_data:
  wp_data:
```

Step 4: Start containers

```
docker compose up -d
```

Step 5: Check running containers

```
docker ps
```

Step 6: Open WordPress

Open in browser: <http://localhost:8080>

Step 7: Data persistence

Volumes ensure your data is **■■■■■** even after restart.

Step 8: Stop containers

```
docker compose down
```

Reset everything (optional)

```
docker compose down -v
```

Common Issues

Port conflict: change 8080 to another port like 9090.

MySQL delay: restart containers.

Permission issues (Linux):

```
sudo chown -R $USER:$USER .
```

Bonus: Add phpMyAdmin

```
phpmyadmin:
  image: phpmyadmin
  container_name: phpmyadmin
  restart: always
  ports:
```

```
- "8081:80"  
environment:  
  PMA_HOST: db
```
